4. Secure water lines into place to prevent movement.
5. After sheet rock is installed and painted, press faceplate into place.
6. Attach the supply lines to the valves and attach to the washing machine.
7. Turn on water supply. Check valves and hoses for leaks.

## **To Change Valve Configuration:**

*Tools Required: 8mm hex key & crescent wrench*

1. Using a crescent wrench, hold the valve body in place at the base of the inside of the appliance box.
2. Insert an 8mm hex key into the Tectite by Apollo push-to-connect fitting until it seats properly and turn counter-clockwise completely removing the fitting from the valve body.
3. Remove the slim retaining nut which will allow for the removal of the valve body.
4. Turning the box 180 degrees so the top becomes the bottom will reveal knockouts for a side oriented drain and the appropriate valve placement locations.
5. Insert the valves, tighten the retaining nut and push fittings back into place. The integrated o-ring design eliminates the need for the use of thread tape or sealant.
